

1. Write a function named `Round` that is passed a `Double` parameter named `num`. The function returns that value rounded to the nearest whole number using normal rounding and not Banker's Rounding. You can assume as a precondition that `num` is greater than zero.

2. Write a function named `ComputeTax` that is passed two `Double` parameters named `price` and `taxRate`. The function must return the value of the sales tax on a purchase that costs `price` at a tax rate of `taxRate`. You can assume as preconditions that both parameters are greater than 0 and that tax rate is a percentage such as 0.06.

3. Write a function named `ComputeRandom` that returns a random integer between or including 2 and 20.
